

**JET PROPULSION LABORATORY****INTEROFFICE MEMORANDUM**

IOM 392R-21-005

March 30, 2021

TO: Sec. 392

FROM: D. Farnocchia (Jet Propulsion Laboratory, California Institute of Technology)

SUBJECT: Small-Body Perturber Files SB441-N16 and SB441-N343

This memorandum presents the small-body perturber file SB441-N373, which is available for use with JPL planetary ephemeris DE441. The file includes the ephemerides of the 373 small-body perturbers used by Park et al. (2021) for DE440 and DE441. A second file SB441-N16 is also available and contains the same ephemerides restricted to the 16 most massive perturbers in the main asteroid belt.

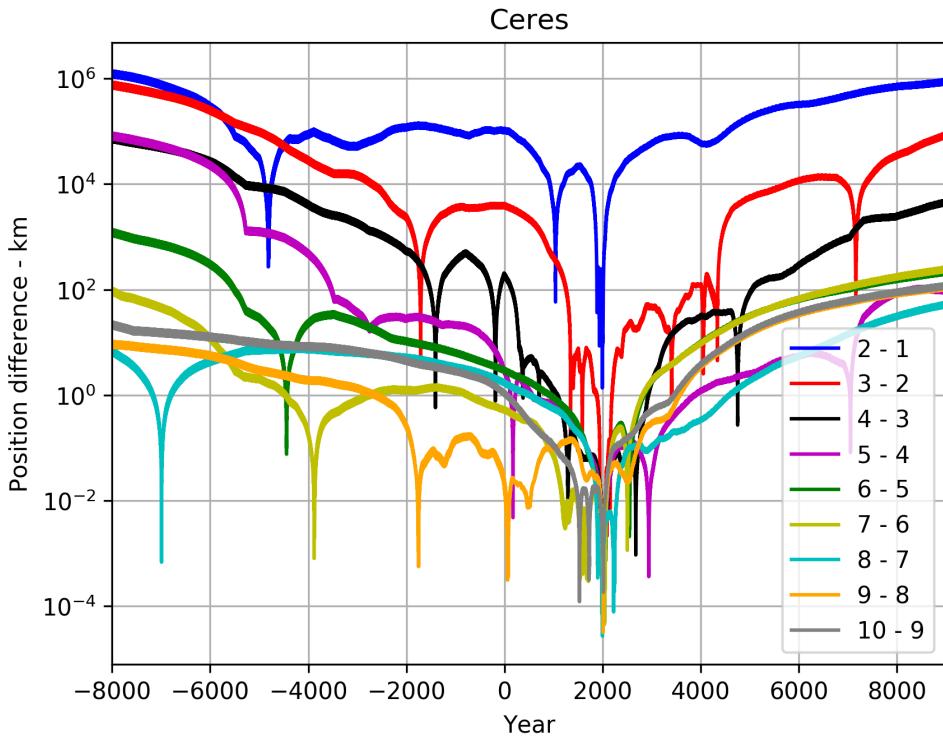

We generated the small-body ephemeris (SBE) perturber file (Chamberlin 1998) SB441-N373 containing the mutually perturbed ephemerides of the 373 small bodies used for JPL planetary ephemerides DE440 and DE441 (Park et al. 2021). Table 1 provides the corresponding list of perturbers and their masses, which are set according to the DE441 planetary ephemeris solution. In addition to the 343 small-body perturbers already considered for DE431 (Folkner et al. 2014, Farnocchia 2017), this perturber set also includes 30 Kuiper Belt objects. The reduced file SB431-N16 contains the same ephemerides but only for the 16 most massive bodies in the main asteroid belt. The two SBE files cover the time interval from 8001 BC-12-21 TDB (JD -1200525.5) to 9000-01-01 TDB (JD 5008242.5).

We generated SB441-N373 and SB441-N16 with the same iterative procedure used to create the previous SB431-N16 and SB431-N343 small-body perturber files (Farnocchia 2017). The orbit of each perturber was integrated relative to the solar system barycenter using DE441 as a reference planetary ephemeris. At each iteration the orbit of each perturber was estimated based on the following dataset:

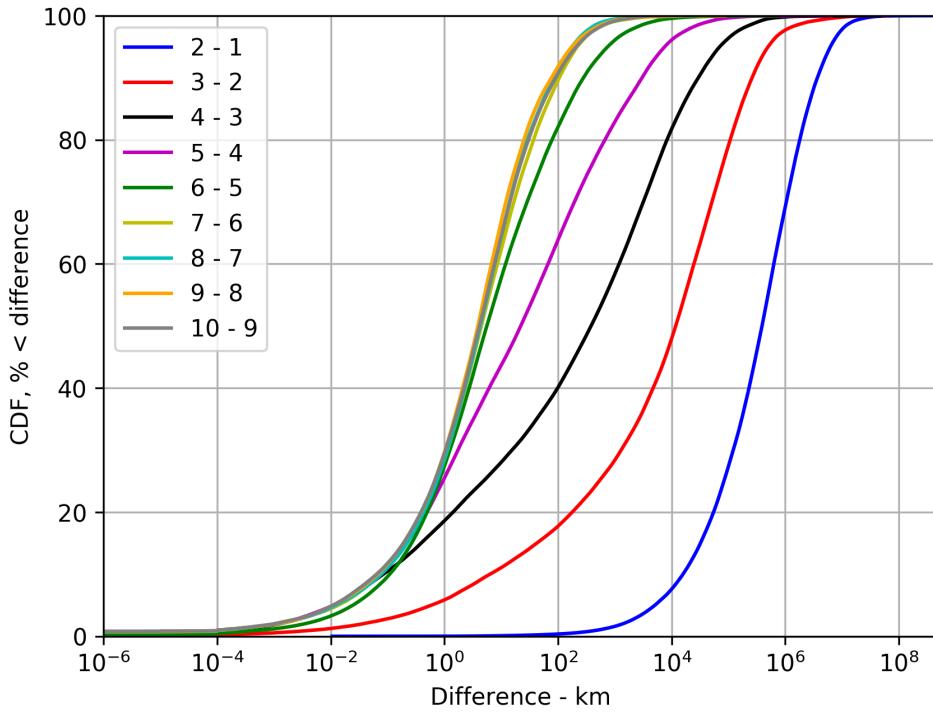

- 1) All available optical astrometry from the Minor Planet Center (<https://minorplanetcenter.net>) from January 1950 to March 2021. Earlier observations have the potential for larger, non-random errors and were therefore ignored. We corrected the astrometry for star catalog systematic errors using the Eggl et al. (2020) debiasing scheme and weighted the data according to Veres et al. (2017). Outliers were rejected based on the Carpinino et al. (2003) scheme with  $\chi_{\text{rej}} = 3$ .
- 2) High-accuracy astrometry from the second data release of Gaia (Gaia Collaboration 2018).
- 3) Asteroid radar delay and Doppler measurements (Ostro et al. 2002, <https://ssd.jpl.nasa.gov/?radar>).
- 4) Pseudo-range points for Ceres and Vesta from the Dawn mission (Konopliv et al. 2014, 2018).

Figure 1 shows the position differences between consecutive iterations as a function of time for (1) Ceres. While the Ceres position is well constrained at the time of the observations included in the orbital fit, position differences tend to increase toward the ends of the time interval, i.e., from year 8001 BC to year 9000. This behavior is expected and common to all the 373 asteroids considered in the analysis.

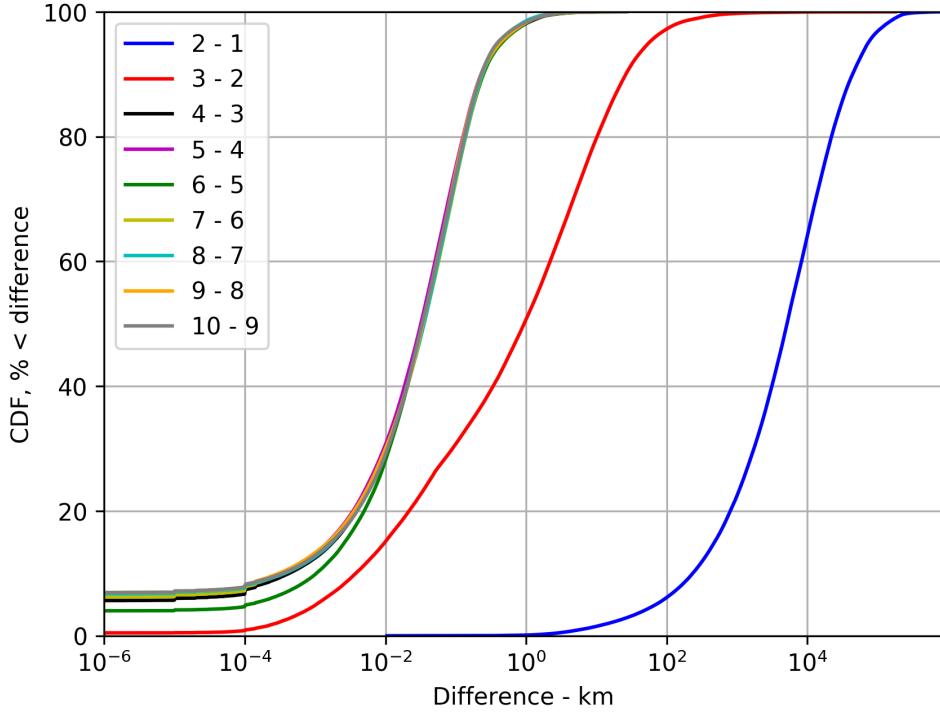

For a more comprehensive assessment, Figure 2 shows the cumulative distribution of the position differences between consecutive iterations for all 373 perturbers. The procedure converges in terms of minimizing the differences between iterations after six iterations. The final trajectory differences can be as large as 1000 km as we approach the ends of the considered time interval, where the fidelity of the ephemeris necessarily degrades. However, as shown by Figure 3, the vast majority of these differences are within 1 km from year 1500 to 2500. These position differences are a mere measure of convergence and should not be interpreted as a measure of the ephemeris uncertainty.

**Figure 1.** Position differences between consecutive iterations as a function of time for Ceres.

**Figure 2.** Cumulative density function of the position differences between consecutive iterations for all 373 perturbers. The time interval is from year -8001 to year +9000.

**Figure 3. Cumulative density function of the position differences between consecutive iterations for all 373 perturbers. The time interval is from year 1500 to year 2500.**

The new SBE files correspond to the sixth iteration and are available on nexus at the following path:

nexus:/home/dfarnocc/data/sb441-n373.nio	(NAVIO native format)
nexus:/home/dfarnocc/data/sb441-n16.nio	(NAVIO native format)

#### ACKNOWLEDGEMENTS

The research was carried out at the Jet Propulsion Laboratory, California Institute of Technology, under a contract with the National Aeronautics and Space Administration (80NM0018D0004).
